

Dwelling Fire, Homeowners Owner-Occupied, and Homeowners Tenant and Condominium/Cooperative Unit Owner's Insurance Report: Data for 2022

May 2025

The NAIC is the authoritative source for insurance industry information. Our expert solutions support the efforts of regulators, insurers and researchers by providing detailed and comprehensive insurance information. The NAIC offers a wide range of publications in the following categories:

Accounting & Reporting

Information about statutory accounting principles and the procedures necessary for filing financial annual statements and conducting risk-based capital calculations.

Consumer Information

Important answers to common questions about auto, home, health and life insurance – as well as buyer's guides on annuities, long-term care insurance and Medicare supplement plans.

Financial Regulation

Useful handbooks, compliance guides and reports on financial analysis, company licensing, state audit requirements and receiverships.

Legal

Comprehensive collection of NAIC model laws, regulations and guidelines; state laws on insurance topics; and other regulatory guidance on taxation and consumer privacy.

Market Regulation

Regulatory and industry guidance on market-related issues, including antifraud, product filing requirements, producer licensing and market analysis.

NAIC Activities

NAIC member directories, in-depth reporting of state regulatory activities and official historical records of NAIC national meetings and other activities.

Special Studies

Studies, reports, handbooks and regulatory research conducted by NAIC members on a variety of insurance-related topics.

Statistical Reports

Valuable and in-demand insurance industry-wide statistical data for various lines of business, including auto, home, health and life insurance.

Supplementary Products

Guidance manuals, handbooks, surveys and research on a wide variety of issues.

Capital Markets & Investment Analysis

Information regarding portfolio values and procedures for complying with NAIC reporting requirements.

White Papers

Relevant studies, guidance and NAIC policy positions on a variety of insurance topics.

Dwelling Fire, Homeowners Owner-Occupied, and Homeowners Tenant and Condominium/Cooperative Unit Owners Insurance: Data for 2022

Market Distribution and Average Cost by Policy Form and Amount of Insurance

Purpose of Report

This report provides countrywide and state-specific premium and exposure information for non-commercial dwelling fire insurance and for homeowners insurance package policies. Homeowners package policy data are for the homeowners owner-occupied policy forms (HO-1, HO-2, HO-3, HO-5 and HO-8), the tenant policy (HO-4) and the condominium/cooperative unit owner's policy (HO-6). This narrative describes the data and discusses the way economic, demographic and natural phenomena impact the price of homeowners insurance.

Data

Data consist of written exposures, expressed as house-years,¹ and aggregate written premiums by state and countrywide for the 2022 data year. Premium and exposure information was collected for all states and the District of Columbia. The data are displayed in five tables. Three tables show individual state and countrywide exposures grouped by 1) policy type; 2) individual policy form; and 3) amount of insurance coverage, divided into ranges, with percentages of total exposures provided. The last two tables display by-state and countrywide average premiums. Average premiums are calculated by dividing premiums by exposures for each policy form and range of insurance coverage and represent the cost of a year of coverage. Percentages of totals are provided.

Policy forms included in the report are described in detail in the following section. The ranges of insurance amounts extend to higher levels of coverage for the dwelling fire and homeowners owner-occupied policy forms than those for the tenant and condominium insurance, because premiums for the latter two policy forms do not include coverage for the residential structure.

To the extent that data are reported to statistical agents, data for statutorily established FAIR plans are included.

This report is not comprehensive of all statistical agents as there may be smaller statistical agents that do not report data to the NAIC. The data is limited to what was provided by the following companies, whose cooperation and assistance in compiling this report is greatly appreciated:

- Data for all states, except Texas and California, were provided by the American Association of Insurance Services; ISO Data, Inc.; the National Independent Statistical Service; Independent Statistical Service, Inc. (ISS); and the Mutual Service Office (MSO).

¹ One house-year represents policy coverage on a dwelling for 12 months. Most often, it consists of coverage for one policy for an entire 12-month period, but it may also represent a number of policies for which the combined lengths of coverage *total* 12 months (e.g., four policies, each with three months of coverage).

- Texas data were obtained from the Texas Department of Insurance. Historically, the Texas department developed its own home insurance policy forms that are similar, but not identical, to homeowners policy forms countrywide. Although, starting in 2002, insurers were permitted to file their own independent forms, some companies continue to use the forms previously promulgated by the department.
- California data were provided by the California Department of Insurance. The state began collecting homeowners data in 1998, starting with the 1996 data year.

Limitations on the Data

Average premium is an imperfect measure of the relative “price” of insurance due to wide variations in hazards, economic conditions, and real estate values from state to state. Even when comparing identical policy forms and amounts of insurance, premiums for homeowners coverage can differ dramatically across the country. These market differences are explored in more detail in a later section of this narrative. Premium for a homeowners policy is determined by the amount of insurance purchased (generally based on the value of the insured property), the types of property covered, the types of perils covered, and the specific limits and deductibles a policyholder chooses.

Averages developed for this report reflect all these variables and more. For each state, some general assumptions can be made about the types of insurance policies sold, the value of property insured, and policyholders’ cost for loss protection for residential property and personal belongings.

Residual Market Data

Beginning with the 2011 data year, this report has sought to include data directly from residual market mechanisms. These mechanisms serve as a state's insurer of last resort and/or to write high-risk policies, such as wind-only supplemental policies. When possible, complete policies and supplemental policies were either categorized as the form number associated with the underlying policy or in accordance with the residual market mechanism's criteria. If the underlying policy was unavailable, the supplemental policies were marked as HO-3 policies, the most common owner-occupied policy form. For the supplemental policies, premium has been included, but exposures were excluded. This was done to avoid double-counting, as it is likely the underlying primary policy, and its exposure, has already been included in the report.

The cooperation and assistance of the residual market data providers in compiling this report were greatly appreciated. Data were provided by the Alabama Insurance Underwriting Association; Florida Citizens Property Insurance Corporation; Louisiana Citizens Property Insurance Corporation; Massachusetts Property Insurance Underwriting Association; Michigan Basic Property Insurance Association; Mississippi Windstorm Underwriting Association; Mississippi Residential Property Insurance Underwriting Association; New Jersey Insurance Underwriting Association; North Carolina Joint Underwriting Association; Ohio FAIR Plan Underwriting Association; Rhode Island Joint Reinsurance Association; South Carolina Wind and Hail Underwriting Association; and Virginia Property Insurance Association.

Policy Forms/Types

Data for this report were collected for eight policy forms that are grouped into three broad categories (policy types) for comparison purposes.

Dwelling fire policy (one family, owner-occupied, non-seasonal buildings)

Under a dwelling fire policy, an insured may purchase coverage for perils other than fire. The data for single-family owner-occupied dwellings in this report includes coverage not limited to fire. The dwelling fire data (indicated by "DW" in the report) are not directly comparable to the homeowners data but are presented to provide an estimate of the cost for insurance purchased under the dwelling fire program.

Homeowners package policies for owner-occupied dwellings (1-4 family units)

- HO-1: Basic "named-perils"² coverage on buildings and personal property.
- HO-2: Broad "named-perils" coverage on buildings and personal property; provides coverage for more perils than HO-1 package.
- HO-3: Provides "all-risks"³ coverage on buildings, broad named-peril coverage on personal property; most common package written.

² Insures against any loss incurred by the insured due to a peril named in the policy (e.g., fire, lightning, hail, etc.).

³ Insures against risks of direct loss, except losses **specifically** stated in the policy as excluded from coverage (e.g., flood).

- HO-5: Provides “all-risks” coverage on buildings and personal property.
- HO-8: Repair cost coverage for a dwelling whose replacement cost greatly exceeds its market value. Personal property, theft and additional coverages provided are similar to coverages provided under an HO-1 policy.

Homeowners package policies for tenants, condominium and cooperative unit owners

- HO-4 (Renter’s Insurance): Broad “named-perils” coverage for the personal property of tenants.
- HO-6 (Condo/Co-op Insurance): Broad “named-perils” coverage for personal property of condominium or cooperative unit owners, as well as certain building items in which the unit owner may have an insurable interest.

Homeowners owner-occupied policies represent a “package” of coverages for buildings, contents and liability. Accordingly, in each coverage range, the average premium for the dwelling fire policy represents less coverage than the corresponding homeowners policies. Homeowners tenants and condominium policies are similar to homeowners owner-occupied policies with respect to covered perils, contents coverage and liability. However, there is no building coverage other than the condo/co-op owner’s insurable interest.

Analysis of the Data

Table 1 provides exposure data in house-years by policy type. The table shows a countrywide total of 98,500,006.4 house-years. In 2022, homeowners owner-occupied policy exposures accounted for 69.1 percent of overall exposures countrywide. Tenant and condominium policy exposures accounted for 29.1 percent of the total, while dwelling fire exposures made up the remaining 1.8 percent.

Exposure data for the eight individual policy forms is provided in Table 2. The HO-3 accounted for 54.6 percent of all policy exposures and remains the most common policy sold by far. Figure 1 (next page) shows the percentage breakdown of exposures for the homeowners owner-occupied policy forms only. Countrywide, 78.99 percent of these exposures were written on the HO-3 form.

Figure 2 shows the percentage breakdown of countrywide exposures for the tenant and condo/co-op policy forms. Of these, 76.3 percent were written on the HO-4 form.

**Figure 1 - 2022 Percent of Homeowners Owner-Occupied
Written Exposures
Countrywide By Policy Form**

**Figure 2 - 2022 Percent of Tenant and Condominium/
Co-op Written Exposures
Countrywide By Policy Form**

Tables 3A and 3B present countrywide and by-state exposure data divided between each of the ranges of insurance coverage amount. Dwelling fire policy data and data for the homeowners owner-occupied policy forms are grouped together in Table 3A, and data for the HO-4 and HO-6 forms are grouped together in Table 3B. Countrywide, in 2022, 59.7 percent of dwelling fire and homeowners owner-occupied policies were written for insurance coverage amounts between \$150,000 and \$400,000.

Tenant and condominium policies do not provide coverage for the building; therefore, the distribution of exposures for these types of policies is concentrated at significantly lower insurance amounts. Table 3B shows that 68.7 percent of the exposures for the HO-4 and HO-6 forms are concentrated at amounts below \$35,000, and 93.1 percent of these policies provide less than \$80,000 in coverage.

Figure 3 provides a comparison of dwelling fire and the five homeowners owner-occupied policy exposures by amounts of insurance coverage. Dwelling fire exposures represent 2.5 percent of total exposures and are most prevalent at insurance coverage amounts less than \$150,000.

Figure 4 compares HO-4 and HO-6 policy forms by coverage amounts. Countrywide, the HO-4 (tenants) form represents more policies written at lower coverage amounts. At coverage amounts above \$60,000, the majority of exposures are written on the HO-6 (condo/co-op) form.

Tables 4⁴ and 5 display state average premiums for each policy form. Examining the countrywide average premium data for dwelling fire and homeowners owner-occupied policies reveals some expected results. In general, the average premium increases as the amount of coverage increases for all policy types. Dwelling fire premiums are generally lower when compared to the five homeowners premiums, reflecting the more limited coverage offered by dwelling fire policies compared to homeowners packages.

⁴ Negative and zero exposures and premiums are denoted by an asterisk in Table 4. All exposure and premium amounts, including those that are negative, are included within the Table 4 totals.

Figure 3 - 2022 Percent Comparison of Dwelling Fire and Homeowners Owner-Occupied Written Exposures by Amount of Insurance

Figure 4 - 2022 Percentages of Tenant and Condominium Written Exposures by Amount of Insurance

Factors Affecting the Cost of Insurance

Geographic Area, Real Estate and Construction Costs

Many factors impact the cost of home insurance, resulting in large differences in average premiums throughout the United States. In general, real estate values and construction costs tend to be higher in areas of greater population density. Because the amount of home insurance needed is based on the value of the home, premiums are often higher in more heavily populated places. Vacation and retirement areas, as well as areas experiencing rapid economic growth, also tend to have relatively higher real estate values.

Construction costs vary based on the type of residence, availability of building materials and factors such as local climate and building regulations. Higher expected repair costs for value-added designs to reduce damages to the structure from earthquakes or hurricanes will impact the price of insurance. As shown in the following maps, these variations in costs are reflected in the range of median amounts of insurance purchased throughout the United States.

Catastrophe Exposure

Degree of exposure to catastrophe affects the cost of insurance to homeowners. Brush and forest fires, tornadoes, high winds, hail, freezing rain, snowstorms, hurricanes, earthquakes, riots and even terrorist attacks are all types of catastrophes that can occur in the United States. Every place in the world has an exposure to some type of catastrophe, but some areas are more prone to certain types. Brush and forest fires are more common in the West. Hurricane exposure is greater in southeastern coastal areas. Exposure to tornado damage is greatest in the central and southeastern United States, even though tornadoes can and do occur in nearly every state. Earthquake exposure also exists throughout the country because seismic faults are located in all regions.⁵ Terrorist attacks also are not specific to any geographic area but have typically occurred in larger urban areas.

⁵ Although earthquake coverage is commonly endorsed onto a homeowners insurance policy, premiums for earthquake coverage are not included in the data.

2022 Homeowners Median Amount of Insurance

2022 Dwelling Fire Median Amount of Insurance

Since the late 1980s, catastrophes have been occurring with greater frequency and severity, and are a significant consideration in the pricing of home insurance. The provided data on catastrophe losses include natural disasters that cause at least \$25 million in insured losses; or 10 deaths; or 50 people injured; or 2,000 filed claims or homes and structures damaged. This data includes losses sustained by private insurers and government-sponsored programs such as the National Flood Insurance Program. For the period 2015-2024, the total insured losses for U.S. catastrophes (in 2024 dollars) were more than \$886.2 billion.⁶

The following table shows, in descending order of loss, the 10 most costly insured property U.S. natural catastrophes through 2024.⁷ Three of these were hurricanes that occurred in 2017, including Hurricane Maria.

Rank	Year	Peril	Dollars when Occurred (millions)	In 2024 Dollars (millions)*
1	2005	Hurricane Katrina	\$65,000	\$104,471
2	2022	Hurricane Ian	52,500	57,231
3	2021	Hurricane Ida	36,000	41,540
4	2012	Hurricane Sandy	30,000	40,939
5	2017	Hurricane Harvey	30,000	38,571
6	2017	Hurricane Irma	30,100	38,432
7	2017	Hurricane Maria	29,500	37,743
8	1992	Hurricane Andrew	16,000	35,845
9	1994	Northridge, CA earthquake	15,300	33,035
10	2008	Hurricane Ike	18,200	26,259

Natural disasters that cause at least \$25 million in insured losses; or 10 deaths; or 50 people injured; or 2,000 filed claims or homes and structures damaged. Includes Puerto Rico and the U.S. Virgin Islands. Includes losses sustained by private insurers and government-sponsored programs such as the National Flood Insurance Program. Subject to change as loss estimates are further developed. As of January 2025.

*Adjusted for inflation by Aon using the U.S. Consumer Price Index.

⁶ Insurance Information Institute, www.iii.org/facts_statistics/catastrophes-us.html; Subject to change as loss estimates are further developed. As of January 2025. Adjusted for inflation by Aon using the U.S. Consumer Price Index.

⁷ Ibid.

The Federal Emergency Management Agency (FEMA) definition of disaster includes chemical emergencies, coastal storm, dam failure, drought, earthquake, fire, fishing losses, flood, freezing, human cause, hurricane, landslide, severe ice storm, severe storm, snow, terrorism, tornado, toxic substances, tsunami, typhoon, volcano, and wildfire. The following table lists the number of declared disasters, by state and year.⁸

2018-2022 Disaster Declarations

The number of tornadoes averaged 1,287 per year during the 2015-2024 period, but the number in individual years ranged from a low of 976 in 2016 to a high of 1,810 in 2024.⁹ These figures serve to emphasize the variability and unpredictability of catastrophe losses. The impact that various catastrophes have on rates from state to state must be considered in any evaluation of average premiums.

⁸ Federal Emergency Management Agency (FEMA), www.fema.gov/disasters/grid/year, as of 12/31/2024.

⁹ Insurance Information Institute, www.iii.org/facts_statistics/tornadoes-and-thunderstorms.html; U.S. Department of Commerce; Storm Prediction Center; National Weather Service.

Insurers use computer models to estimate the potential cost of catastrophic events, particularly in the absence of a sufficient amount of relevant loss experience. For example, the potential insured loss in the New Madrid region due to an earthquake is predicted to be significant, but the fact that the last major earthquake in that area occurred in 1812—when there were considerably fewer people and buildings—makes it difficult to rely on previous experience to accurately price earthquake coverage in the area.

Computer models use insurer exposure and loss experience; geological, meteorological and seismic data; structural engineering and construction data; and other applicable information to simulate catastrophes in a specific region to more accurately estimate the cost of paying for losses that could occur. The methodology used by a catastrophe-modeling firm is typically considered proprietary information, and insurance regulators have no direct authority over the modelers. However, when a rate filing relies in part on a computer model, an insurance department may require an insurer or rating organization to provide supplemental information pertaining to the model's input data to determine whether the filing meets the requirements of the state insurance laws.

Mold Damage

High insurance claim payments for mold damage garnered the attention of media outlets several years ago. This can be attributed to higher numbers of claims filed, as well as some extraordinary amounts awarded to claimants by judges and juries in certain areas of the country. Many insurers have considered mold an excluded peril, and the cost of paying for potential claims related to mold has not generally been factored into the price of most property policies. However, courts in several states have found that, in the absence of specific exclusionary language in the policy, payment for certain types of mold damage is required. Examples include ancillary mold damage that results from an otherwise covered peril, the liability of builders for mold damage that results from new construction methods and materials, or the liability of property owners for potential health problems related to inhalation of mold spores.

Insurers have discovered that the repair of mold damage to property can be expensive. In response, insurers have added language to property and liability policies to explicitly exclude or limit coverage for mold. Some insurers have raised overall premiums to better reflect this exposure, while others offer mold-related coverage for an additional cost.

Terrorism

The 2001 attacks on the World Trade Center and the Pentagon caused insurers to reassess their exposure to terrorist strikes on U.S. soil. Insurers now consider potential property claims that would result from terrorist attacks a significant risk and have taken steps to price the coverage appropriately. The September 11, 2001, terrorist attack on this country largely affected commercial insurers and reinsurers, but some personal property (including homes and autos) was also lost. Overall, however, the threat of terrorism has not affected the cost of homeowners coverage.

Other Variables

There are several other variables that impact the frequency and severity of home insurance losses and contribute to its cost. Loss experience and premiums among states and regions will vary considerably due to unique combinations of these variables. The following are some of the more significant factors contributing to these differences.

Building Structures: Recent losses from natural disasters, especially hurricanes and earthquakes, have increased awareness of the importance of minimizing the potential for damage to both new and existing structures. Many municipalities in high-risk areas have implemented more stringent building codes, resulting in changes in design and building materials; in addition to new homes, older homes are being retrofitted to comply with new building codes. The cost to repair or replace more expensive materials has impacted premiums. Over the long run, however, the implementation of stricter building codes will result in structures that are less vulnerable to damage, which can help to reduce premiums. Specialized building features, such as the wood shingle roof that is prone to hailstorm and lightning damage, can ultimately impact premiums in areas where they become increasingly popular.

Population Density: Various trends evident in the data are related to the level of urbanization in an area. Urban areas tend to have more renters than rural areas. The District of Columbia, for example, is entirely urban. Approximately 66.5 percent of policies sold in Washington, D.C., in 2021 were tenant or condo/co-op policies, which reflects the high number of transient government employees and contractors living there. States with large numbers of seasonal workers and those with popular tourist and retirement locations might also tend to have higher percentages of tenant and condo/co-op policyholders. Not surprisingly, Florida, a major retirement state, and New York, which has a high number of tenants and condo/co-op owners in New York City, also have relatively high percentages of tenant and condominium/co-op exposures.

In addition, the fire suppression capacities in a given locale significantly impact home insurance rates. Insurers employ classification systems that measure such items as response times and proximity of a dwelling to a fire station and to working fire hydrants. It is rarely cost-feasible for rural areas to maintain the level of fire protection available to urban residents.

Economic Factors: Economic phenomena have a significant impact on home insurance premiums. Inflation increases the amount of insurance premiums over time. Interest rates and inflation have an effect on both real estate values and the price of durable consumer goods insured as contents.

Regulatory Environment: Rate and form filing laws for home insurance vary among states. Some states require insurers to file rates and policy forms for home insurance and have them approved before they can be used. Other states require rates and/or policy forms to be filed by the day they will be used, or within a given number of days following the effective date. In addition, the role played by regulators in setting and/or reviewing rates varies among the states.

Other: The risk of fires resulting from faulty heating systems is lower in warmer climates. However, other common causes of fires, such as careless smoking, cooking, electrical problems, and children playing with matches, are not unique to any geographic region. There is generally an increased cost to insure homes with wood burning fireplaces, multi-car garages, and wooden decks. On the other hand,

added features that reduce the risk of loss, such as security systems and fire detection devices, will often qualify a home for premium discounts.

Summary

Many factors impact home insurance premiums and losses. Real estate values, building and construction costs, vulnerability to catastrophes, the level of urbanization, and legal and economic phenomena result in wide variations in premiums, not only by region or state, but on local levels as well. Although the data in this report do not provide the necessary information for a thorough analysis of the effect of these factors on home insurance premiums, it is important to recognize the variety of factors that are reflected in the price of insurance.

The tables in this report were prepared under the direction of the Casualty Actuarial and Statistical (C) Task Force. Suggestions about how this report might be further improved are welcome. Questions may be referred to Aaron Brandenburg at (816) 783-8271 or Libby Crews at (816) 783-8563.

The National Association of Insurance Commissioners (NAIC) is the U.S. standard-setting and regulatory support organization created and governed by the chief insurance regulators from the 50 states, the District of Columbia, and five U.S. territories. Through the NAIC, state insurance regulators establish standards and best practices, conduct peer reviews, and coordinate regulatory oversight. NAIC staff support these efforts and represent the collective views of state insurance regulators, domestically and internationally. NAIC Members, together with the central resources of the NAIC, form the national system of state-based insurance regulation in the U.S.

For more information, visit **naic.org**.
